Why am I interested in working at Tether?

My interest in Tether comes from building with your stack. Over the past few weeks I built PearNote, a collaborative notes app using the Holepunch P2P technology. Two devices sharing a live list in real time, no server, no account, no cloud. And it was a genuinely enjoyable experience. The tools are so well designed that getting started felt natural, almost effortless.

What really hooked me was going beyond the surface. I could have let AI generate the whole thing blindly and shipped it in an afternoon. Instead I went deep on understanding why it works, and the more I learned, the more fascinating it became. The technology is genuinely clever and complex, and I did my best to explain it to a general audience without being too simplistic.
That's what this video is about: https://www.youtube.com/watch?v=B8783WSrCjI . It was one of the most rewarding challenges I've taken on in a while.

I also went beyond the code. I installed Keet, joined the Pear Groups, and found a wonderful community full of people discussing genuinely interesting things who helped me along the way. I watched talks by David Mark Clements (Holepunch Principal Architect) explaining the technology, and interviews with Paolo Ardoino (Tether CEO). The more I saw of the people and the vision behind all of this, the more I wanted to be part of it.

I'll be honest: **Developer Advocate is not a title I've held yet**. But I've been doing the work. In my last role as Solutions Engineer at **N-SIDE**, an advanced tool for optimizing complex supply chain and clinical trials in the pharmaceutical industry; I spent five years split between **building** and **customer-facing** work. I led a new API product from conception to production, guided clients through integration with screencasts and hands-on support, wrote all external documentation, produced video tutorials and demos, presented new features to customers and the wider community, and answered a constant stream of technical emails. It's the same craft as **DevRel**, I just never had the title. I can't wait for the chance to make it official.

On the engineering side, I have more than ten years of experience shipping real code in demanding, complex industries. I've worked on hard software problems in clinical trial optimization, supply chain logistics, and advanced analytics, sectors where the problems are intricate and the stakes are high. That background means I can understand complex technology and complex customer needs at the same time. But my strongest skill is what

happens after I understand something: I simplify it, break it down, and help other people get there too. That's the skill I'm most proud of, and exactly what a Developer Advocate does every day.

And why Tether specifically? Because what you're building goes way beyond code. For ten years I've watched the industry consolidate: data stored on servers you don't own or control, accounts that lock you in, algorithms deciding what you can do with your own information... **P2P** and **local AI** are a statement about who should own your data and who should control your tools. P2P means no middleman between you and the person you're sharing with. Local AI means intelligence that runs on your device, on your terms. Together they give real power, real privacy, and real control back to the user, where it belongs.

Very few companies are built to succeed because of open source and decentralization rather than in spite of it. Tether thrives when these technologies win, and its success is tied to a healthier, more open, more democratic tech ecosystem. That's not just a business strategy, that's a mission. And it's an ecosystem I don't just want to use. I want to help it grow, one developer at a time.
